New isolated nucleic acid molecules encoding HLRRSII polypeptides, or their fragments and homologues, useful for preventing, treating and amelicrating medical conditions, e.g. proliferative, gastrointestinal. renal disorders

Claim 1; Figure 1; 336pp; English

The invention relates to isolated nucleic acid molecules (I) encoding human leucine-rich repeat small intestine I (HiRRSII) polypeptides.

The nucleic acid molecules and polypeptides are useful for preventing, treating and ameliorating medical conditions, such as proliferative, gastrointestinal, renal, neural, or reproductive disorders; or disorders related to aberrant calcium regulation or apoptosis modulation, either directly or indirectly. They are also useful for treating, preventing and/or or disposing diseases, disorders and/or conditions of: immune system by activating or inhibiting the proliferation, differentiation, or mobilisation of immune cells; haematopoietic cells e.g. thrombocytopenia, or nutus (HIV) infection, HIV-BLV infection, block coagulation disorders, or arterial thrombosis; autoimmune disorders, e.g. Addison's disease, or asterial thrombosis; autoimmune disorders, e.g. Addison's disease, or arterial thrombosis; autoimmune disorders, e.g. Addison's disease, conditions, e.g. chronic prostatiis, sepsis; proliferative disorders, e.g. achieves a sentem or allergic reactions; inflammatory conditions, e.g. chronic prostatiis, sepsis; proliferative disorders, e.g. achieves an ergonia, infectious disorders, e.g. atrhythmia, myocardial schemmans, neurysas, neurological disorders, e.g. atrhythmia, myocardial minimum conditions, or viral, bacterial, and fungal infections. The HiRRSII processes such as boosting immune responses.

Chebsolas-labera are useful for modulating sequences and PCR primers of the processes such as abosting immune responses.

 The present sequence is human G-protein coupled receptor-2 (GCREC-2) genetic deficiency, to express a conditionally lethal gene product and to express a protein which affords protection against intracellular parasites and also for diagnosis of disorders associated with expression of GCREC (GCREC is also useful for generating hybridisation probes useful in mapping the naturally occurring genomic sequences and to create knockin humanised animals (page) or transgenic animals (mice or rats) to model human diseases. GCREC is used to diagnose, prevent and treat proliferative disorders (actinic keratosis, arteriosclerosis, cirrhosis, hepatitis and cancer); cancer (breast, bladder, bone marrow, brain, uterus cancer, leukaemia, adenocarcinoma, lymphoma, melanoma and myeloma)

 Human G-protein coupled receptor-2 (GCREC-2) cDNA.
 ន្ម
 "Human GCREC-2 protein"
 'n
 Au-Young J, Yang
 Claim 5; Page 159-160; 175pp; English.

human leucine-rich repeat small intestine I (HLRRSII) polypeptides.

human leucine-rich repeat small intestine I (HLRRSII) polypeptides.

The invelor acid molecules and polypeptides are useful for preventing,

treating and ameliorating medical conditions, such as proliferative,

gastrointestinal, renal, neural, or reproductive disorders; or disorders

conditions aberrant calcium regulation or apoptosis modulation, either

conditions aberrant calcium regulation or apoptosis modulation, either

conditions or inhibiting the proliferation, differentiation, or mobilisation of immune cells; haematopoietic cells e.g. thrombocytopenia,

anaemia; immunologic deficiency syndromes, e.g. human immune deficiency

conditions, e.g. chronic prostatitis, sepsis; proliferative disorders,

conditions, e.g. chronic prostatitis, sepsis; proliferative disorders,

conditions, e.g. chronic prostatitis, e.g. arrhythmia, myocardial

ischaemias, aneurysms; neurological disorders, e.g. Alzheimer's disease,

duntington's chorea; infectious diseases, e.g. arrhythmia, myocardial

conditions, or viral, bacterial, and fungal infections, The HLRRSII

polypeptides are useful for modulating oytokine production, antigen

chassistation, or other processes such as boosting immune responses.
 New isolated nucleic acid molecules encoding HLRRSII polypeptides, or their fragments and homologues, useful for preventing, treating and ameliorating medical conditions, e.g. proliferative, gastrointestinal,
 Sequence 2763 BP; 544 A; 890 C; 870 G; 459 T; 0 other;
 Example 1; Page 221-222; 336pp; English.

 The invention relates to isolated nucleic acid molecules (I) encoding human leucine-rich repeat small intestine I (HizRSII) polypeptides. The nucleic acid molecules and polypeptides are useful for preventing, treating and ameliorating medical conditions, such as proliferative, gastrointestinal, renal, neural, or reproductive disorders; or disorders related to aberrant calcium regulation or apoptosis modulation, either directly or indirectly. They are also useful for treating, preventing and/or diagnosing diseases, disorders and/or conditions of: immune systemmody or inhibiting the proliferation, differentiation, or mobilisation of immune cells; haematopoietic cells e.g. thrombocytopenia, anaemia; immunologic deficiency syndromes, e.g. human immune deficiency
 Human; human leucine-rich repeat small intestine I; HLRRSII; asthma; proliferative disorder; gastrointestinal disorder; renal disorder; neural disorder; calcium regulation; apoptosis; immune system, anaemia; human immune deficiency virus; iIV; cancer; blood coagulation disorder; autoimmune disorder; allergic reaction; inflammatory condition; cardiovascular disorder; ischaemia; neurological disorder; infectious disease; cytokine production;

 This invention describes novel human NOVX polypeptides which have cytostatic, cardiant, antiarteriosclerotic, antiasthmatic and hypotensive activity. Pharmaceutical compositions comprising the NOVX proteins or nucleic acid molecules or NOVX antibodies are useful for preventing or treating a disorder associated with aberrant NOVX carpression or activity e.g. cancer, hypertension, atherosclerosis, cardiomyopathy or bronchial asthma. The products of the invention can be used for gene therapy or in a vaccine. ABX97008-ABX97185 are cDNA fragments amplified and isolated by the PCR primers and probes represented in ABX13460-ABX13462 and ABX97186-ABX975931. ABX97008-ABX97185 encode the NOVX proteins described in ABU65041-ABU65218.

 The present invention relates the DNA and their encoded proteins, where the proteins contain at least one PYD (pyrin) domain. These can be used to treat diseases associated with impaired intracellular signal transduction, particularly inflammation such as porials, arteriosclerosis, bacterial or viral infections (particularly meningitis and pneumonia), multiple sclerosis, rheumatoid arthritis, asthma, astocidosis, glomerulonephitis and osteoarthritis, and also Alzheimer's and Parkinson's diseases. The present sequence is a coding sequence of the invention.

The sequence encodes human activated T-lymphocyte associated sequence 2, ATLAS-2. ATLAS-2 is related by homology to cytokine receptors and its gene is located on chromosome lipi5.5. ATLAS proteins, polymucleotides and antibodies are useful for treating/preventing conditions associated with an autoimmure disorder, cell differentiation disorder, and immune deficiency disorder amount disorder, cell differentiation disorder, activity or of latency or predisposition to an immune disorder.

ATLAS proteins, polymucleotices and antibodies are useful in therapeutic or prophylactic treatment of diseases associated with cell-proliferation (e.g. cancers, malignancies and tumours). The polymucleotides are useful or prophylactic treatment of diseases associated with cell-proliferation (e.g. cancers, malignancies and tumours). The polymucleotides are useful in gene therappy, to defect ATLAS mana or a genetic lession in an ATLAS gene, to modulate ATLAS activity, to screen drugs or compounds that condulate ATLAS activity, to screen drugs or compounds that condulate ATLAS activity or expression and to treat disorders are useful compared by insufficient or excessive production of ATLAS protein forms that have decreased or aberrant production of ATLAS protein forms that have decreased or aberrant conduntity individuals. The antibodies are useful for treating/preventing infection by bacteria, viruses and fungi, affecting bodily characteristics, e.g. contantication, isolation and detection of ATLAS and to monitor procein levels in tissue. ATLAS is useful for treating/preventing infection by bacteria, viruses and fungi, affecting bedily characteristics, and for metabolism, affecting behavioural contant transgenic and in a produce non-human transgenic and and an antibodies and the advance of a samination and the antibodies are useful to produce non-human transgenic

bind to polypeptides of the invention. Although novel, many of the polypeptides of the invention have homology to known proteins, thereby glaving an insight into their probable biological activities, and hence obtential therapeutic applications. The polypeptides of the invention may differentiation activities, stem cell growth factor activity; activity tissue growth activity; had activity; call proliferation or cell fferentiation activities; stem cell growth activity; immunomodulatory activity; tissue growth activity; immunomodulatory activity; activing or inhibin-related activities; chemotactic or chemokinetic activities; hadmostatic, thrombolic or thrombolytic activities; receptor or ligand activities; or may be considered or may activities; perpending on their biological activities, polypeptides and nucleotides of the invention are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. Such conditions include conditions, e.g., by protein or gene therapy. Such conditions include cancers, haematopoietic disorders (e.g., myeloid or lymphoid cell disorders), chronic inflammatory conditions (e.g., asthma or arthritis), proliferative retinopachy, athersoletosis, coronary heart disease.

Concers, haematopoietic disorders (e.g., osteoporosis), and abnormal vascular growth. Polypeptides involved with tissue regeneration and repair (or nucleic acids encoding them) may be used to promote wound repair (or nucleic acids encoding them) may be used to promote wound content and fungal infections and diction to immune disease or aciding them may be used in cell cultures to promote cell growth. For example, such polypeptides may be used to manipulate stem cells in culture to give rise to neuropithelial cells in the disposes or accidental darage. The polypeptides and indecides of the conditions, and indexing may also be used in the present sequence of the invention.

Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and sequences ABA0825-ABA09574 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comprising a nuclectide of the invention, methods of producing the novel polypeptides, antibodies against the polypeptides, methods of detecting the nucleotides or polypeptides, methods of identifying compounds which

Human proteins and DNA encoding sequences useful for preventing, treating or ameliorating a medical condition in a mammalian subject

 This sequence encodes a recombinant angiotensin II cAMP/vasopressin-
v2 (AII/AMPV2) receptor polypeptide. AII and AVP receptors are both
G protein-coupled receptors with diverse physiological roles. AII
receptors respond to the neurotransmitter angiotensin II whilst AVP
receptors respond to arginine vasopressin. I soreceptors have been
described for both AVP and AII, this is consistent with their
functional diversity. The recombinant receptor of the invention may
be derived from a mammal, preferably a human or a rat. This sequence
may be used in the construction of vectors for the expression of the
recombinant receptor. Fragments of the extracellular domain of the
receptor are useful as immunogens for producing antibodies which
(Updated on 25-WAR-2003 to correct PN field.)

AAK54531 to AAK64702 encode the human immune/haematopoietic antigen (I) and can be used in gene therapy and vaccine production. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) proteins and polynucieotides may be used in the prevention, diagnosis and proteins and polynucieotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a paisent's genome that the patients own production of (I). Additionally, (I) polynucleotides may be used to produce the secreted (I), by inserting polynucleotides may be used to produce the secreted (I), by inserting the caids into a host cell and culturing the cell to express the protein. (I) proteins and polynuclectides may be used to prevent, adagnose and treat immune/haematopoietic-related diseases, especially concers and cancer metastases of haematopoietic-drived cells. AAK64703 to AAK87694 represent human immune/haematopoietic artiger genomic sequences from the present invention. AAK49492 to AAK54950 and AAM82169 expressent invention.

AAX5451 to AAX64702 encode the human immune/haematopoietic antigen (1) and can be used in gene therapy and vaccible production.

Cactivity, and can be used in gene therapy and vaccible production. (1) proteins and polymucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (1) expression. For example, they may be used to treat disorders associated with decreased expression by rectlying mutations or delations in a patient's genome that affect the activity of (1) by expressing inactive proteins or to supplement the patients own production of (1). Additionally, (1) polymucleotides may be used to produce the secreted (1), by insering the nucleic acids into a host cell and culturing the cell to express the protein. (1) proteins and polymucleotides may be used to provent, diagnose and treat immune/haematopoietic-related diseases, especially cancers and cancer metastases of haematopoietic-derived cells AAK64703 to AAK87694 represent human manume/haematopoietic antigen genomic sequences from the present invention. AAK84942 to AAK84985 and AAM82169 represent invention.

 The invention relates to movel genes (ABL88449-ABL90853) and proteins (ABB89040-ABB90444) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant) agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovariant cancers of the adrenal gland, bone, hone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy, and (f) infectious diseases such as viral, bacterial, fungal

 This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-CpG-3', present in a genomic sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated C, to uracil, then part of the genomic CDNA that contains the target C is amplified to form a labeled amplicon. The amplicon of short peptide nucleic acid (BNA) oligomers and the degree of hybridisation to both classes is determined from the member, of oligomers. The amplicon. From the ratio of labels hybridised to the two classes of oligomers, the degree of methylation is calculated. The method is used: (i) for diagnosis and/or prognosis of side effects of the remember of cauga and of a wide range of diseases, e.g. cancer, discretely systems etc. particularly by detecting mutations or single nucleotide polymers and for investigating cell differentiation. The method allows the methylation status of many C residues to be determined simultaneously. Application feacuse is each of the disclosure of the invention.

This invention describes a nove, method for determining the degree of methylation of a particular cytosine in a motif 5'-CpG-3', present in a genomic sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated C, to uracil, then part of the genomic DNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of Digonuclectides and/or peptide-nucleic acid (DNA) oligomers and the degree of hybridisation to both classes is determined from the lasses of oligomers, the degree of methylation is calculated. The method is used: (i) for diagnosis and/or prognosis of side effects of the reapeutic drugs and of a wide range of diseases, e.g. cancer, disorders of the central nervous, cartilovascular, gastronnessinal and respiratory systems etc., particularly by detecting mutations or single nucleotide polymorphisms (SNP's); and (i) for differentiation of cell or tissue polymorphisms (SNP's); and (i) for differentiation of cell or tissue the methylation status of many C residues to be determined simultaneously.

Appla410-ABO\$4121 represent genomic DNA sequences used to illustrate the choosing the control of the determining the degree of cytosine methylation described in the disclosure of the invention.

This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-CpG-3', present in a genemic sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated C, to uracil, then part of the genemic DNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of oligonucleotides and/or peptide-nucleic acid (PNA) oligoners and the degree of hybridisation to both classes is determined from the label on the amplicon. From the ratio of labels hybridised to the two classes of oligoners, the degree of methylation is calculated. The method is used: (i) for diagnosis and/or prognosis of side effects of therapeutic drugs and of a wide range of diseases, e.g. cancer, disorders systems etc., particularly by detecting mutations or single nucleotide polymorphisms (SNP's); and (ii) for differentiation of cell or tissue types and for investigating cell differentiation. The method allows the methylation status of many C residues to be determined simultaneously. ABQ13410-ABQ54121 represent genomic DNA sequences used to illustrate the method for determining the degree of cytosine methylation described in of the central nervous, cardiovascular, gastrointestinal and respiratory useful drug; side effect; cancer; central nervous system; cardiovascular; gastrointestinal; respiratory system; single nucleotide polymorphism; Human; cytosine methylation; 5'-CpG-3'; uracil; cytosine; diagnosis; Oligonucleotide for detecting cytosine methylation SEQ ID NO 16563. ō for diagnosis and prognosis, comprises selective hybridization Determining the degree of cytosine methylation in genomic DNA, 43 GTTTTTTAGTAAAAGGAGTTGTCGGGCGTGTTGGAGATAGAG Claim 12; 56pp + Sequence Listing; 56pp; German. Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

modified polylinker; Site_1: Not I; Site_2: Eco RI; Plasmid DNA from the normalized library NoI CGAP COLG was prepared, and ss circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs (from a pool of 5,000 clones made from the same library (clonelDs 1057416-106125s, and 1144584-1145351).

 Feder, J., Ramanathan, C. and Mintier, G.
Human leucine-rich repeat containing protein,
predominantely in small intestine, HLRRSII
Patent: WO 02061086-A 5 08-AUG-2002;
Bristol-Myers Squibb Company (US)

```
NOTE: This is a 'working draft' sequence. It currently consists of 19 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence preserved
 21001 contig of 2:001 bp in length
21102 40714 contig of 19513 bp in length
40815 58430 contig of 19513 bp in length
58831 66745 contig of 14280 bp in length
6685 81134 contig of 14280 bp in length
89664 101889 contig of 10636 bp in length

 NOTE: Estimated insert size may differ from sequence length.

(see http://www.hgac.bcm.tmc.edu/docs/Genbank draft_data.html).

NOTE: This is a "working draft' sequence. It currently consists of 4 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown.

This record will be lipdated with the finished sequence as soon as it is available and the accession number will be preserved.

 The invention relates to isolated nucleic acid molecules (1) encoding human leucine-rich repeat small intestine I (HIRRSII) polypeptides.

Chantoleic acid molecules and polypeptides are useful for preventing, treating and amelication medical conditions, such as proliferative, gastrointestinal, renal, neural, or reproductive disorders, or disorders related to aberrant calcium regulation or apoptosis modilation, either directly or indirectly. They are allowed. for treating, preventing and/or diagnosing diseases, disorders and/or conditions of: immune system. Or mobilisation of immune for instance of instance of instance of instance or institution, and remains immunologic deficiency syndromes, e.g. human immune deficiency virus (HIV) infection, HILV-BLV infection; blood coagulation disorders, or arterial thrombosis; autoimmune disorders, e.g. human immune disorders, e.g. arterial thrombosis; autoimmune disorders, e.g. Addison's disease, mysthenia gravis; aschma or altergic reactions; inflammatory conditions, e.g. chronic prostatitis, sepsis; proliferative disorders, e.g. cancer; candovasculat disorders, e.g. arthythmia, mycoardiai ischaemias, aneurysms; neurological disorders, e.g. Arthythmia, candovasculat disorders, e.g. measles, mumps, presentation, or viral, bacterial, and fungal infections. The HERRSII polypeptides are useful for modulating cytokine production, antigen presentation, or other processes such as boosting immune responses.

Absequed.

The present sequence is human G-protein coupled receptor-2 (GCREC-2)

CDNA. GCREC is useful in somatic or germline gene therapy to correct a

Genetic deficiency, to express a conditionally lethal gene product and

to express a protein which affords protection against intracellular

to parasites and also for diagnosis of disorders associated with expression

of GCREC. GCREC is also useful for generating hybridisation probes useful

in mapping the naturally occurring genomic sequences and to create

knockin humanised animals (pigs) or transgenic animals (mice or rats) to

model human diseases. GCREC is used to diagnose, prevent and treat

complexative disorders (actinic keratosis, arteriosclerosis, cirrhosis,

complexative disorders (epilepsy, strok, Alzheimer's, Huntington's,

reurological disorders (epilepsy, strok, Alzheimer's, Huntington's,

complexinal disorders (dysphadia, peptic oesophagitis, oesophageal

complexinamiatory disorders (acquired immunodeficiency syndrome (AIDS),

complexinal disorders (acquired immunodeficiency syndrome (AIDS),

 The invention relates to isolated nucleic acid molecules (I) encoding human leucine-rich repeat small intestine I (HLRRSII) polypeptides. The nucleic acid molecules and polypeptides are useful for preventing, treating and amelicrating medical conditions, such as proliferative, gastrointestinal, renal, neural, or reproductive disorders; or disorders of disorders and/or disorders, or interestly or indirectly. They are also useful for treating, preventing and/or disgnosing diseases, disorders and/or conditions of immune calls, haematopoietic cells e.g. thrombocycopenia, by activating or inhibiting the proliferation, differentiation, or mobilisation of immune calls, haematopoietic cells e.g. thrombocycopenia, anaemia; immunologic deficiency syndromes, e.g. human immune deficiency virus (HIV) infection, HTLV-BLV infection; blood coagulation disorders, e.g. arterial thrombosis; autoimmune disorders, e.g. Addison's disease, mysthenia gravis; asthma or allergic reactions; inflammatory conditions, e.g. chronic prostatitis, sepsis; proliferative disorders, e.g. nanex, aneurymas, neurological disorders, e.g. Althommer's disease, thirthonic, showes inferious or massine.
 194

 65
 Huntington's chorea; infectious diseases, e.g. measles, mumps, pneumonia, or viral, bacterial, and furgal infections. The HirkSin polypeptides are useful for modulating cytokine production, antigen presentation, or other processes such as bosting immune responses. ABS61863-ABS61804 represent HirkSil coding sequences and PCR primers of
 New isolated nucleic acid molecules encoding HIRRSII polypeptides, cr
their fragments and homologues, useful for preventing, treating and
ameliorating medical conditions, e.g. proliferative, gastrointestinal,
or renal disorders

hypotensive activity. Pharmaceutical compositions comprising the NOVX proteins or nucleic acid molecules or NOVX antibodies are useful for proteins or nucleic acid molecules or NOVX antibodies are useful for preventing or treating a discreter associated with aberrant NOVX expression or activity e.g. cancer, hypertension, atheroscierosis, cardiomyopathy or bronchial asthma. The products of the invention can be used for gene therapy or in a vaccine. ABX97088-ABX97188 are cDNA fragments amplified and isolated by the PCR primers and probes represented in ABX13460-ABX1462 and ABX97186-ABX97533. ABX97008-ABX97185 encode the NOVX proteins described in ABU65041-ABU65218.

 The present invention relates the DNA and their encoded proteins, where the proteins contain at least one PYD (pyrin) domain. These can be used to treat diseases associated with impaired intracellular signal transduction, particularly inflammation such as psoriasis, arteriosclerosis, bacterial or viral infections (particularly meningitis and pneumonia), multiple sclerosis, rhenmatoid arthritis, sathma, sarcoidosis, glomerulonephicis and osteoarthritis, and also Alzhenmer's and Parkinson's diseases. The present sequence is a coding sequence of

Sequences ABB10981-ABB12130 represent 1350 novel human polypeptides, and sequences ABA08225-ABA09574 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comprising a nucleotide of the invention, methods of producing the movel polypeptides, antibodies against the polypeptides, methods of detecting the moreleotides or polypeptides in a sample, and methods of identifying compounds which bind to polypeptides of the invention. Although novel, many of the polypeptides of the invention have homology to known proteins, thereby giving an insight into their probable biological activities, and hence potential therapeutic applications. The polypeptides of the invention may have various activities, including cytokine, cell proliferation or cell differentiation activities; stem cell growth factor activity; charmatopiesis regulatory activity; tissue growth activity; inmunomodulatory activity; activin- or inhibin-related activities; chemotactic or chemokinetic activities; harmostatic, thrombotic or thrombolycic activity; activin- or inhibin-related activities; or may be involved in oncogenesis, cencer cell proliferation or metastasis.

Chemotactic on their biological activities, polypeptides and nucleotides of the invention are useful for preventing, treating or ameliorating medical

cancers, haematopoietic disorders (e.g., myeloid callations, include cancers, haematopoietic disorders (e.g., myeloid or lymphoid cell disorders), chronic inflammatory conditions (e.g., asthma or arthritis), proliferative retainopathy, atherosclerosis, coronary heart disease, arterial ischaemia, bone disorders (e.g., osteoporosis), and abnormal vascular growth. Polypepides involved with tissue regeneration and repair (or nucleic acids encoding them) may be used to promote wound repair (or nucleic acids encoding them) may be used to promote wound immunomodulatory activities may be used in the treatment of viral, bacterial and fungal infections in addition to immune disorders.

Colypeptides with growth factor activity may be used in cell cultures to promote cell growth. For example, such polypeptides may be used to manipulate stem cells in culture to give rise to neuroepithelial cells that can be used to augment or replace cells damaged by illness, and nucleotides may also be used in the diagnosis of the above conditions, and in drug screening techniques. The present sequence represents a cDNA encoding a

AAK54951 to AAK64702 encode the human immune/haematopoietic artigen (1) anino acid sequences given in AAM82170 to AAM91921. (1) have cytostatic cativity, and can be used in gene therapy and vaccine production. (1) proteins and polynucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (1) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (1) by expressing inactive proteins or to supplement the patients own production of (1). Additionally, (1) copolymucleotides may be used to produce the secreted (1), by inserting the nucleic acids into a host cell and culturing the cell to express the protein. (1) proteins and polynucleotides may be used to prevent. (2) diagnose and treat immune/haematopoietic-related diseases, especially cancers and cancer metastases of haematopoietic-dericanticen genomic to AAK6764 represent human immune/haematopoietic antigen genomic sequences from the present invention. AAK54950 and AAM92169

AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (1) arino acid sequences given in AAM82170 to AAM91921. (1) have cytostatic activity, and can be used in gene therapy and vaccine production. (1) proteins and polynucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (1) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (1) by expressing inactive proteins or to supplement the patients own production of (1). Additionally, (1) couplement the patients own production of (1). Additionally, (1) the nucleic acids into a host cell and culturing the cell to express the protein. (1) proteins and polynucleotides may be used to prevent, diagnose and treat immune/haematopoietic-related diseases, especially cancers and canner metastases of haematopoietic antigen genomic cancer metastases of haematopoietic antigen genomic sequences from the present invention. AAK84950 and AAM82169 represent sequences used in the exemplification of the present invention. Nucleic acids encoding human immune/hematcpoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis -Claim 1; SEQ ID NO 7801; 3071pp + Sequence Listing; English 2001-483426/52.  The invention relates to novel genes (ABL89449-ABL90833) and proteins (ABB80347,ABB9044) useful for preventing, treating or amaliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The mucleic acids, proteins, antibodies and (ant) agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohm's disease, multiple sclerosis, rheumatoid arthritis and ulcerative

 The present invention relates the DNA and their encoded proteins, where the proteins contain at least one PYD (pyrin) domain. These can be used to treat diseases associated with impaired intracellular signal transduction, particularly inflammation such as psoriasts, arteriosclerosis, bacterial or viral infections (particularly meningitis and pneumonia), multiphe sclerosis, rheumatoid arthritis, asthma, sarcoidosis, glomerulonephritis and osseoarthritis, and also Alzheimer's and Parkinson's diseases. The present sequence is a coding sequence of

```
The invention comprises the amino acid and coding sequences of human PYRIN proceins. The PYRIN procein and DNA sequences of the invention are useful. for moditating and diagnosing stress-related, apoptopic and inflammatory responses. The MYRIN protein and DNA sequences are useful for treating: inflammatory disorders and immune system disorders (e.g. Crohn's disease, reactive arthritis, multiple sclerosis, contact dermainis, psoriasis, graft rejection, allergies, viral infections and bacterial infections); cancer (e.g. leukaemia); autoimmune disorders (e.g. systemic lupus erythematosus and arthritis); and neurological giseases (e.g. Alzheiner's disease and Parkinson's disease). The PYRIN protein and DNA sequences may also be used in screening assays, detection assays (e.g. chromosomal mapping, tissue typing or forensic biology), predictive medicine (e.g. diagnostic assays, clinical trials and

The invention relates to human NBS-1 nucleotide binding site) and PYRIN-1 protein and nucleic acids. NBS-1 and PYRIN-1 DNA, protein and their modulators are useful in the treatment of approtic and inflammatory disorders, cancer (leukaemia, melanoma, carcinoma); viratinflammatory disorders, cancer (leukaemia, melanoma, carcinoma); viratinflammatory disorders (S.E.); immune-mediated glomentomal, viratinflammatory disorders (S.E.); immune-mediated glomentomal, arthritis, arthritis; neurological disorders (ALS); retinitis pigmentosa, arthritis; neurological disorders (ALS); retinitis pigmentosa, disease, amyotrophic lateral sclerosis (ALS); retinitis pigmentosa, authritis, and seases); aplastic anaemia, ischaemia, meningilis, liver diseases. NBS-1 and PYRIN-1 DNA, protein and their modulators are also used for the treatment of inflammatory and immune disorders such as chord inflammatory diseases such as Crohn's disease, insulin-dependent clabetes, organ specific autoimmunity, including multiple sclerosis, grave's disease, allergy, aschma, HIV, tuberculosis and lepromatous cervosy. The present sequence is a CDNA encoding human PYRIN-1 protein.
